Dreamweaver CC: PSD to HTML and CSS

- Posted on December 8, 2014
- by Tareq Aljaber
- in Dreamweaver Interface

Our team continues to streamline and improve Dreamweaver. It has a modern UI, edit capabilities in Live View, CSS Designer and a 64-bit architecture. That's not all though, it gets even better. It also has a complete integration of Extract which empowers users to easily go from PSD comp to code.

Extract enables web designers and developers to build web and mobile content from a Photoshop comp directly in Dreamweaver, bridging the gap between Photoshop and Dreamweaver, and reducing the need to go back and forth between the two.

Extract Panel

The Extract panel is where all the magic happens. You can easily extract CSS, images, fonts, colors, gradients, measurement and more to help build sites faster. If the panel is not opened by default, you can launch it as follows:

- Launch Dreamweaver CC
- Window > Extract (see **Figure 1**)

Figure 1: Launch the Extract panel in Dreamweaver

Extract Tutorial (onboarding experience)

We've added an onboarding experience to show how easily users can Extract info from a PSD. Click on any layer, text, or image to see how to easily extract info. To get going, click on the "**Get Started**" (see **Figure 2**) button on the top left corner.
